RESEARCH EXPERIENCE

SEPT. 2018–	Reaching for the Edge: the Outskirts of Massive Galaxies with HSC, DECaLS, and Dragonfly
ADVISOR: ALEXIE LEAUTHAUD	
JULY 2017–	Inside-out quenching galaxies with H α ring-like structures
ADVISOR: YINGJIE PENG	We investigated galaxies with H α emission ring-like structures in Mapping Nearby Galaxies at APO (MaNGA) survey, with stellar mass in the range $9 < \log(M/M_{\odot}) < 12$. These galaxies are almost located in the green valley on SFR-stellar mass plane. The radius of H α rings are measured and good linear relations between bar length and H α ring radius are found. We reveal that the appearance of H α star-forming ring-like structure has a strong correlation with bar-induced activities, but not with active galactic nuclei (AGN). The majority of our H α ring galaxy sample are galaxies which are classified as LINER with $EW(H\alpha) < 3\text{\AA}$. Low luminosity AGN possibly plays a role in inside-out quenching accompanying with H α ring-like structure. Morphological quenching and bulge show less relation with H α ring galaxies.
